Defect-class outcome matrix (RQ2)

Every injected defect is a compile error in safe Rust; in C++ each compiles and is caught, if at all, only at runtime

Defect class	C++ · ASan	C++ · TSan	Safe Rust (rustc)
Use-after-free stale ptr into context map	**detected** at runtime	**detected** at runtime	**prevented** compile-time · E0499
Double-free context released twice	**detected** at runtime	**not detected** (clean)	**prevented** compile-time · E0382
Iterator invalidation mutate DRB list while iterating	**detected** at runtime	**detected** at runtime	**prevented** compile-time · E0502
Data race unsynchronised field update	**not detected** (clean)	**detected** at runtime	**prevented** compile-time · E0373
Unguarded shared mutation ctx shared & mutated, no lock	**not detected** (clean)	**detected** at runtime	**prevented** compile-time · E0502

prevented at compile time (safe Rust) · compiles in C++, caught at runtime · sanitiser does not detect it
