What the neighbouring studies control, and what they leave varying

Each prior result is credible on its own terms; none isolates the language for a control-plane subsystem driven into overload

	Cross-language efficiency studies Pereira et al.	**Rust user-space network driver** Emmerich et al.	**Vendor RAN and 5G theses** Karlback; Arvidsson	**This thesis**
Measures a systems language empirically	✓	✓	✓	✓
Latency-critical control-plane domain	✗	-	✓	✓
Reports the tail, not just the average	✗	✗	✓	✓
Drives the system into overload	✗	✗	✗	✓
Holds concurrency model, algorithms, and data structures fixed	✗	✗	✗	✓

The gap in both RAN theses the language varies together with the runtime, the concurrency model, and the implementation, so a measured difference cannot be attributed to the language rather than to the framework built on it. Holding those fixed is what this study adds.
