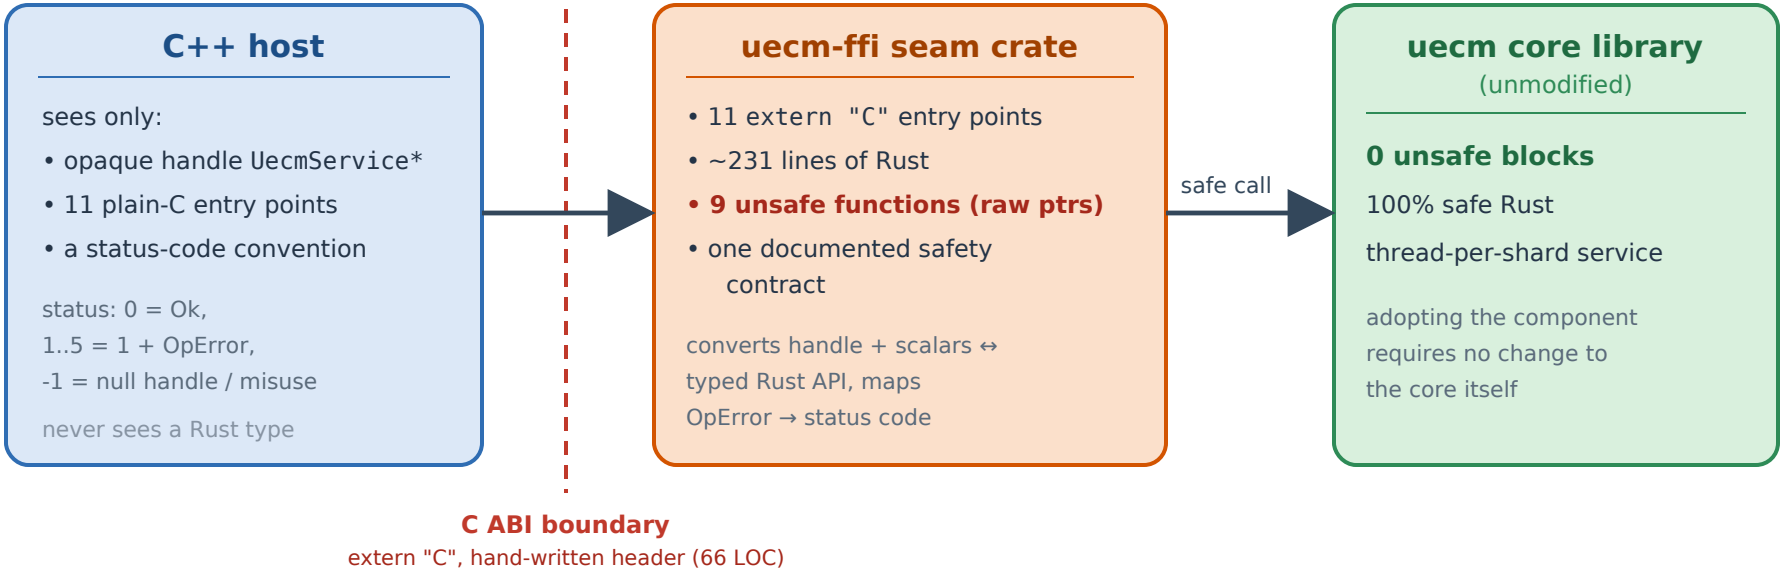
C++ → Rust FFI migration seam (RQ4)

A C++ host drives an unmodified Rust core across a thin C ABI, and all unsafe is confined to the seam crate



Per-operation cost: no seam tax is resolved, and any tax is bounded at +10.9% of one operation

Paired over 15 interleaved repeats: +192 ns, 95% interval −954 to +1341 ns, p = 0.24. The empty crossing costs 2.54 ns and bounds only itself.
